BLISTER CAPSULE PACKAGING MACHINES,
MULTI-TABLET PAK FILLING MACHINES.

WE ARE CAPABLE OF PRODUCING
OVER 100,000 SERVINGS OF PROTEIN PER HOUR.

SCITEC NUTRITION®

QUALITY CONTROL

PROTEIN ANALYSIS

Why the lab tested protein content is the only guaranteed information you need!

- When lab testing a protein product, the only relevant information you really need is the actual protein content.
- Labels don't list actual carbohydrate content anyway. It's calculated from the other measurements (subtracting measured water and ash from sample weight).
- If the protein content matches the label claim, then you know your product is of high-quality and the carbohydrate and fat amounts will be as advertised as well.
- In case a product is not tested, you really have no way of knowing what's in it! The store stops there, you simply rely on label facts. Choose a company that can and is willing to go the extra mile (and cents) to guarantee you the product quality by testing it!
- If a lab test shows that a product's protein content is lower than claimed, the discrepancy will "stick down" to the other ingredients as well as it has to! If the protein content is lower only by 20%, that means that in absolute amounts it's probably 2-3 grams lower per serving. These 2-3 grams must be in real serving as water (water or fat) because it's not possible to have 2-3 grams of carbohydrate or fat in a 20% discrepancy.
- Most consumers use 2 servings (100g) to prepare a shake and drink more than one such that a day, so even if a 10% discrepancy, you may take in 20 grams of uncalculated, hidden carbs and/or fat! And the 10% margin is an accepted value in other parts of the food and supplement industry. Imagine value 20-30% off 10 grams of hidden sugar per day from a product you paid good money for!
